Chapter 7

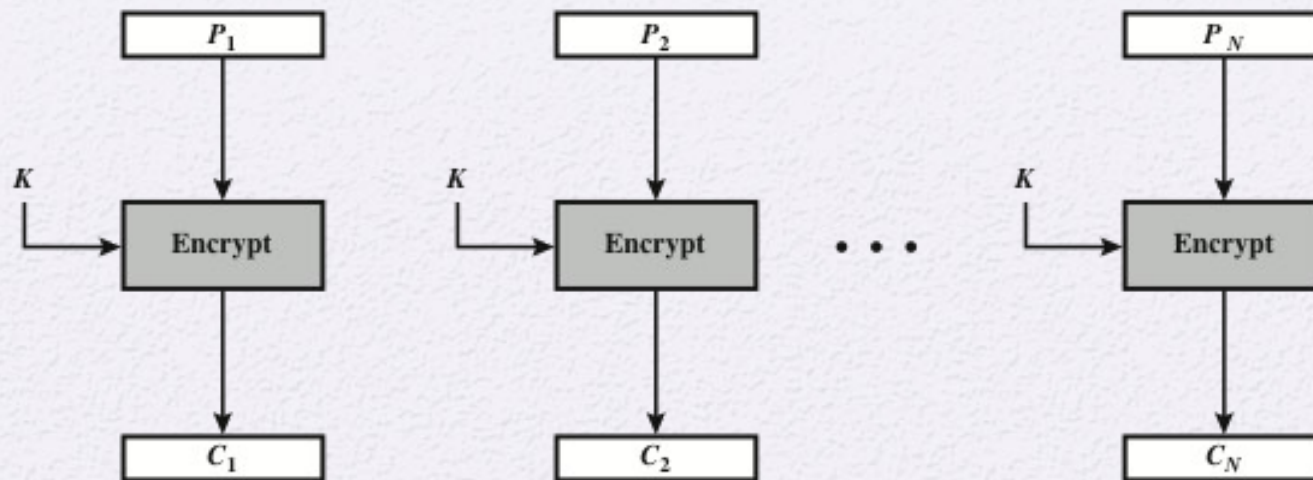

Block Cipher Operation

Modes of Operation

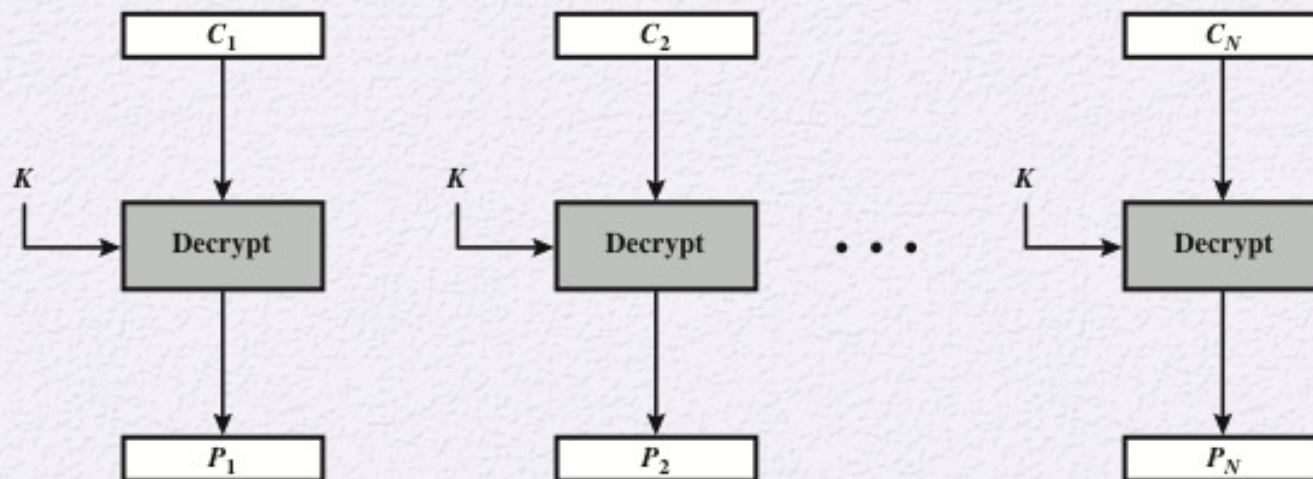

- A technique for enhancing the effect of a cryptographic algorithm or adapting the algorithm for an application
- To apply a block cipher in a variety of applications, five *modes of operation* have been defined by NIST
 - The five modes are intended to cover a wide variety of applications of encryption for which a block cipher could be used
 - These modes are intended for use with any symmetric block cipher, including triple DES and AES

Table 7.1 Block Cipher Modes of Operation

| Mode | Description | Typical Application |
|-----------------------------|--|---|
| Electronic Codebook (ECB) | Each block of plaintext bits is encoded independently using the same key. | •Secure transmission of single values (e.g., an encryption key) |
| Cipher Block Chaining (CBC) | The input to the encryption algorithm is the XOR of the next block of plaintext and the preceding block of ciphertext. | •General-purpose block-oriented transmission •Authentication |
| Cipher Feedback (CFB) | Input is processed s bits at a time. Preceding ciphertext is used as input to the encryption algorithm to produce pseudorandom output, which is XORed with plaintext to produce next unit of ciphertext. | •General-purpose stream-oriented transmission •Authentication |
| Output Feedback (OFB) | Similar to CFB, except that the input to the encryption algorithm is the preceding encryption output, and full blocks are used. | •Stream-oriented transmission over noisy channel (e.g., satellite communication) |
| Counter (CTR) | Each block of plaintext is XORed with an encrypted counter. The counter is incremented for each subsequent block. | •General-purpose block-oriented transmission •Useful for high-speed requirements |

Figure 7.3 Electronic Codebook (ECB) Mode

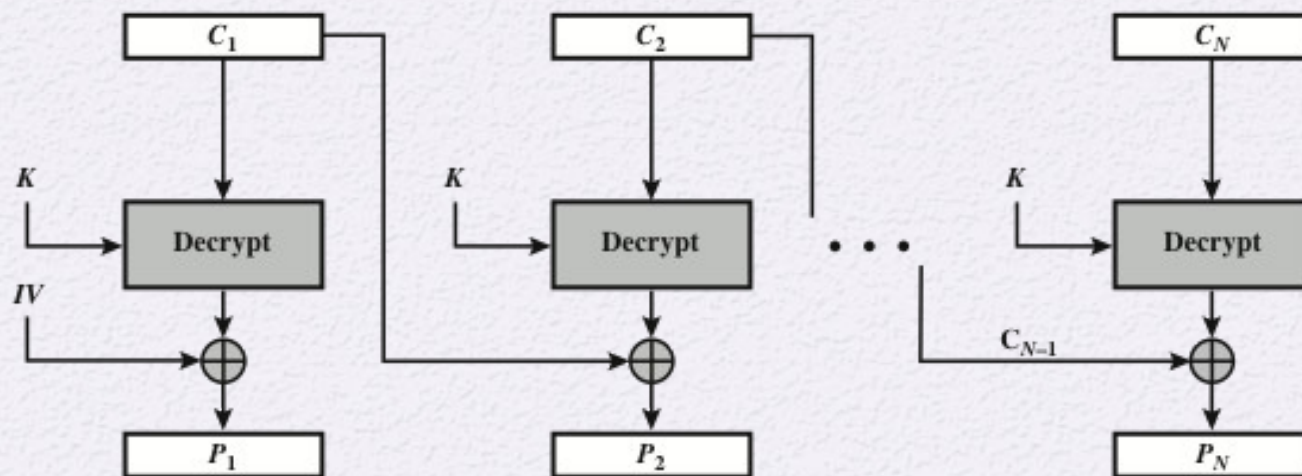

Criteria and properties for evaluating and constructing block cipher modes of operation that are superior to ECB:

- Overhead
- Error recovery
- Error propagation
- Diffusion
- Security

(a) Encryption

(b) Decryption

Figure 7.4 Cipher Block Chaining (CBC) Mode

Cipher Feedback Mode

- For AES, DES, or any block cipher, encryption is performed on a block of b bits
 - In the case of DES $b = 64$
 - In the case of AES $b = 128$

There are three modes that make it possible to convert a block cipher into a stream cipher:

Cipher feedback (CFB) mode

Output feedback (OFB) mode

Counter (CTR) mode

(a) Encryption

Figure 7.7 Counter (CTR) Mode

(b) Decryption

Figure 7.7 Counter (CTR) Mode

Advantages of CTR

- Hardware efficiency
- Software efficiency
- Preprocessing
- Random access
- Provable security
- Simplicity

Figure 7.8 Feedback Characteristic of Modes of Operation

Summary

- Analyze the security of multiple encryption schemes
- Explain the meet-in-the-middle attack
- Compare and contrast ECB, CBC, CFB, OFB, and counter modes of operation
- Present an overview of the XTS-AES mode of operation
